Treelodge@Punggol was launched in March 2007 and is one of the first public housing estates fitted with solar panels to supply energy for lighting in common areas. This helps optimize energy usage and reduce maintenance cost in the estate.

It also has tropical greenery at different levels of the residential blocks. This helps to cool down the building. Light-weight green roofs at residential rooftops cools down surrounding ambient temperature. Each unit has balconies and planters to encourage skyrise gardening.

All of this reduces our reliance on fossil fuels to achieve environmental sustainability.
